

Natural Beauty of Woven Wood

FACTS OF WOVEN WOOD

YARNS

A wide array of natural and man made fibers are used in the making of yarns for woven woods. Pure, bright colors are achieved by using the finest dyes available. Even so, over a period of time slight fading may occur on the exterior side of the shade or the lining, depending on the amount of sunlight the fabric is exposed to. The interior side of the fabric is protected from fading by the slats, but will occur after a long period of time. Due to the product being made of natural material, exact color matches can not be guaranteed from sample to shades.

COLOR VARIATION

Both paint and stain on natural slats are subject to variation. Reed and wood slats will retain the unique grain, nodes and color & shape irregularities inherent from natural woods, water reeds and grasses.

STRETCHING

All natural woven shades may stretch, however it is only noticeable on inside mount installations.

FADING

After a long period of time, exterior and interior discoloration will occur. The colors will become more yellow after exposed to strong sun light.
